## WHEN VISIBILITY MATTERS

Enhancing visibility through the mast not only improves workplace safety but can also make a decisive difference in the speed and efficiency of material handling. Where forklift productivity is a critical success factor, a free-view mast combined with a Hagaberg positioner can be the key advantage.

Hagaberg is one of Europe's leading specialists in mast remodeling with a focus on visibility improvement. With over 20 years of experience, we have had the privilege of carrying out hundreds of projects for most well-known brands on the market. Our service includes design, remodeling, and in most cases, CE marking of the rebuild.

Our specialty is delivering free-view masts with external cylinders. In some cases, however, we also install dual internal cylinders in the mast, which likewise improves visibility. A good example is our conversions from "Duplex without free lift" to "Duplex with free lift and free-view." Combined with our fork positioners and hose routing or hose reels to the attachment, this provides superior results in both visibility and performance.

In certain situations, there is also a need to reposition the hoses running through the mast. To meet this demand, we have developed a range of hose kits that make it possible to reroute the hoses.
